

## Complete ANPR software suite

### KEY FEATURES

- ▶ Innovative software features
- ▶ Comprehensive database
- ▶ Access Control module
- ▶ Web interface for simple, user friendly operation

When a plate is read by the system, it is compared to a database of vehicles which can include whitelisted/blacklisted vehicles. The database is made up of over 100 customisable categories (Staff, Visitor, Delivery, VIP, Unknown etc) which trigger rule-based responses. For example, one category may raise a barrier to allow vehicles during certain hours, to but raise an alert at other times. Unique permissions can even be provided to individual vehicles.

#### Relay Control

Based upon rules in the database, the system can output a signal via a relay card to open gates and barriers, change traffic light signals and raise road blockers. The system is flexible and relays can be operated locally, or many sites can be operated from one central location.

#### Alerts However You Need Them

Emails can be generated in addition to or instead of on-screen alarming in the JMS software to alert to vehicles of interest. This is often used to discretely alert security to potential threats or to alert someone of a VIP's arrival as well as alerting petrol forecourt staff that a vehicle with history of non-payment has entered.

#### Car Park Counting and Space Allocation

Great for town centre car parks or multi-tenanted business parks and company car parks. JMS allows administrators to allocate spaces to certain categories of car park user. For instance, in a car park of 100 spaces, 70 could be allocated to employees, 5 to senior management, 15 to visitors, 5 to contractors and 5 left spare. The system will keep count of entries and exits to ensure that the maximums are enforced and provides a live count showing the status of the overall car park and individual categories. ▶

**JMS software provides a centralised management system utilised around the globe in many industries and applications, including:**

- ▶ Distribution Centres / Warehousing & Logistics
- ▶ Supermarkets / Petrol Forecourt Stations
- ▶ Shopping Centres / Retail & Business Parks
- ▶ Waste Management / Utilities & Infrastructure
- ▶ Private Estates & Clubs / Hotels
- ▶ Car Park Management
- ▶ Airports / Ports of Entry

#### Flexible Database

Perfect for multi-site operations requiring a central database over many locations with the option to monitor some or all sites from one location, and equally functional for a single site.

### Car Park Counting and Space Allocation

Great for town centre car parks or multi-tenanted business parks and company car parks. JMS allows administrators to allocate spaces to certain categories of car park user. For instance, in a car park of 100 spaces, 70 could be allocated to employees, 5 to senior management, 15 to visitors, 5 to contractors and 5 left spare. The system will keep count of entries and exits to ensure that the maximums are enforced and provides a live count showing the status of the overall car park and individual categories.

### Dwell Time Reporting & Overstay

For commercial car parks, it is often important to know how long your guests stay for. Dwell time reporting allows you to do this and filter the report by the time of day, day of the week, or category of visitor. If people outstay their welcome, overstay reports and alarms can be generated by the JMS.

This is also great for monitoring time spent on site by vehicles at Distribution Centres or Delivery Depots.

### Output to LED Signs

Give your visitors a personalised greeting upon their arrival, instruct delivery vehicles which loading bay to approach or display number of free spaces in a car park.

### Car Sharing

**Go green!** Organisations are constantly seeking initiatives to reduce their carbon footprint, so use our Car Sharing module to do this whilst maximising onsite parking.

### Group Tags

For secure sites or applications with multiple lanes, JMS's Group Tag facility offers easy to manage Access Control levels - just the way you need them.

### Timed Entry

If you're running a Logistics or Distribution business, you'll want to keep a grip on your tight schedule of vehicles delivering and collecting – timed entry of individual vehicles can be set within the database to ensure that access is only granted when it should be for pre-arranged time slots.

### Reporting

JMS's advanced reporting function means that whatever information and key metrics you need can be output quickly and easily.

### Frequent Visitor

Ideal for applications such as Waste Management sites or commercial car parks; rules can be set for a maximum number of visits from a vehicle in a configured timescale, whether or not a vehicle is in the database. Vehicles exceeding your pre-defined limit are allocated to a database category from which alarms or access control rules can be generated – for instance, sending an email alert and overview image if a vehicle has visited one or multiple sites more than 3 times in 24 hours, or driven out of a car park and back in within a pre-defined time.

PART NO. INFORMATION	DESCRIPTION
10719, JMS	ANPR Software for local/client PC and/or Server (required for all applications)
10720, Extra License	Additional 8 Connection Licences for JMS
